Nosodes: Usage Suggestions

There are no proven hard and fast rules for using Nosodes however this would be my recommendation

Combination Nosodes (for Distemper, Hepatitis, Leptospirosis, Parvovirus: Canine Combination; Leukaemia, FIV, Panleucopenia and Cat flu: Feline Combo and Myxomatosis/HVD Rabbit Combo)

Give young animals one tablet weekly until either vaccinated using a conventional vaccine or for 2 months and then once a fortnight.

As a treatment for cat 'flu or Kennel cough give one dose daily for 7-10 days then weekly

Kennel Cough Nosodes

Give one tablet daily for 3 days before kennelling or risky situations such as dog shows then once weekly

General Advice on using Homeopathic remedies

Homeopathic remedies are absorbed in the mouth not in the stomach and do not need to be swallowed. You would be advised to leave to dissolve under the tongue so for pets:

Do not bury in food

Use drops or soft tablets into the side of the mouth or crush into powder and throw into the mouth.

You can dissolve in water and give the solution by mouth

Give on a clean mouth not just after or before food tooth brushing etc.
